

Before listening to the first part of the Workshop 'Scientific posters in physics' please prepare the following. The workshop includes tasks, which can only be efficiently worked on, if you are prepared! These steps need to be done in order to create a poster in any case, so they are no extra work load for you!

A. Know your topic for your poster.

B. Define your precise working title of your poster.

- This title can be more specific than e.g. a general research project topic and should represent the focus of the poster. Be aware that your first working title might change during your work and literature search. However, it will provide an important starting point.

C. Collect roughly the possible content of your poster.

- Have all important results, literature and other important material available.
- This first selection will most certainly change during your preparation, however, is a good starting point!
