

Workshop

'Scientific oral presentation'

Before listening to the first part of the Workshop 'Scientific oral presentation in materials science and physics' please prepare the following. The workshop includes tasks, which can only be efficiently worked on, if you are prepared! These steps need to be done in order to create a presentation in any case, so they are no extra work load for you!

A. Know your topic for your presentation.

B. Define your precise working title of your presentation.

- This title can be more specific than e.g. a general research project topic and should represent the focus of the presentation. Be aware that your first working title might change during your work and literature search. However, it will provide an important starting point.

C. Create a rough first outline of your presentation.

- Make a first draft of this outline.
- It might contain keywords of content you think might be relevant.
- This outline will most certainly change during your preparation, however, is a good starting point!
